

Start with the decision.

A one-page AI experiment card

Keep answers brief. A thinking aid, not a validated assessment.

Who uses the result?

Experiment ID / date

1. Decision

What choice should the output help someone make?

2. Action and fallback

What follows the decision? What stays with a person?

3. Evidence and gaps

Sources, dates, permitted use and what remains unknown.

4. Current baseline

How is this done without AI?

5. Acceptance criterion

What counts as an accepted result?

6. Review and stop rules

Who checks errors? When must the experiment stop or hand back?

7. Test before acting

Cases, comparison, time and full costs.

8. Observed result / next decision

Record evidence; unknown stays unknown.

Author-proposed working format. A small pilot does not prove broad reliability.

Compare delivery and review effort with the baseline; do not assume savings.
