Start with a simple budget.

In this fictional example, \$2,000 comes in. Fixed costs are \$1,200 and food is \$400. That leaves \$400.

MONTHLY BUDGET

Money in **\$2,000**

Fixed costs **\$1,200**

Food **\$400**

Money left **\$400**

$\$2,000 - \$1,200 - \$400 = \400

Change one input. See what changes.

Raise the food amount from \$400 to \$500. With the other figures unchanged, the remainder falls to \$300.

The model picks the format.

A chart, a diagram, a form or plain text: Intelligent UI chooses how to arrange an answer around the question.

Good design. Still check facts.

A useful-looking tool can contain wrong numbers or assumptions. Ask for the formula and check the inputs.

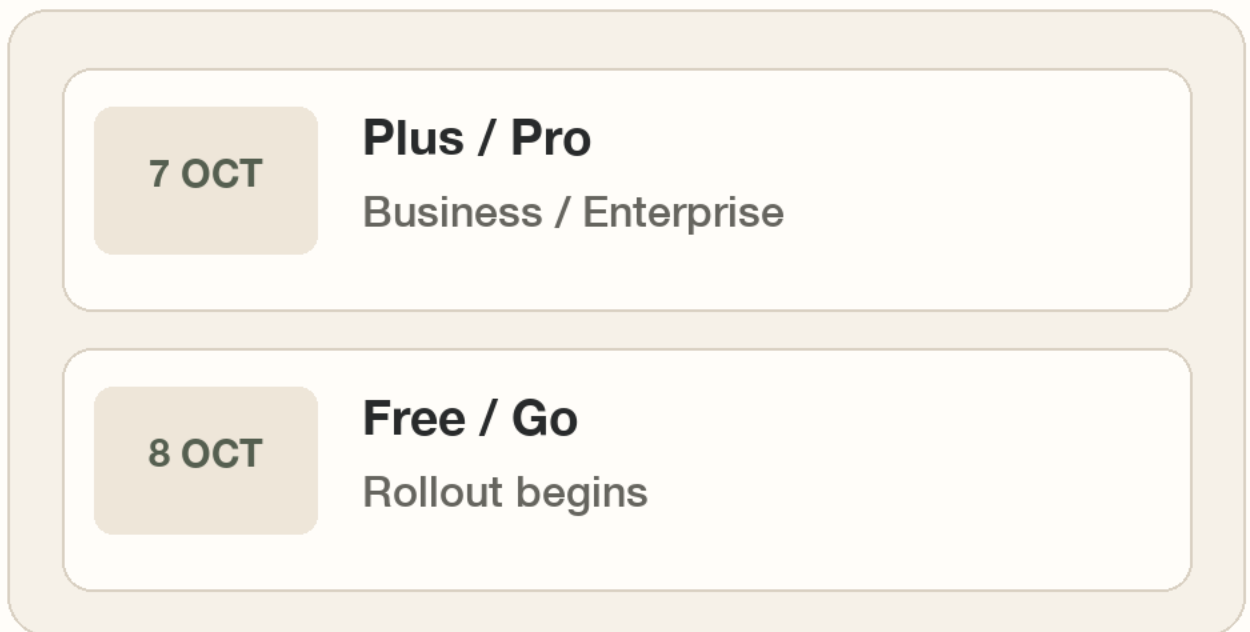

$$2,000 - 1,200 - 500 = 300$$

- Do the inputs match your situation?
- Are any costs missing?
- Does the calculation make sense?

The rollout is gradual.

OpenAI announced rollout from 7 October, then Free and Go from 8 October. Enterprise access depends on admin settings.

Try asking for something usable.

Describe the task, the input you want to change and the result you want to see. Keep the assumptions visible.
